Ford Transit V184 and V384

Rear Wheel Drive *single tire*

L.TRA.EA.C.M

1. FOREWORD

This manual provides instructions for the installation of an auxiliary air suspension kit, developed specifically for the Ford Transit Mark 6; V184 (2000—2006) and the Ford Transit Mark 7; V348 (2006 onwards) **Single tire Rear Wheel Drive**. To ensure correct installation of the kit, it is strongly recommend that these instructions are read thoroughly before commencing any installation work. Installation should only be carried out by a suitably qualified mechanic or specialist installation facility. DSC Nederland will not accept any responsibility for faults or defects arising from incorrect installation, which automatically renders the guarantee invalid.

IMPORTANT : Manufacturer's Declaration Form

A manufacturer's declaration form is provided with your kit. Following installation of the kit please ensure that this form is completed, signed by a qualified fitter and a copy is returned to DSC Nederland by post, fax or e-mail. Our e-mail address is:

L.TRA.EA.C.M

2. INTRODUCTION

Thank you for choosing an auxiliary air suspension kit from the range offered by *DSC Nederland*. Auxiliary air suspension is fitted in tandem with the standard steel springs of the vehicle suspension, and provides enhancements in terms of both the stability of the vehicle and the comfort of the passengers...

Vehicle Levelling

Simply by varying the air pressure in the springs, the vehicle can be levelled both front-to-rear and side-to-side. Keeping the vehicle level optimises stability, ensures correct headlamp beam distribution and reduces tyre wear arising from uneven distribution of weight.

Straight Line Stability

Straight line stability is greatly increased at higher speeds, and when subjected to buffeting from cross-winds or large overtaking vehicles.

Reduced Body Roll

Body roll when cornering or negotiating roundabouts is significantly reduced.

Fatigue Reduction and Wear Compensation

Suspension fatigue is reduced, so helping to prevent leaf springs from sagging under repeated or constant loading.

Any sagging already present can be compensated-for. This is a particular benefit for motorhomes, which are always fully laden.

Ride Comfort

Air springs help to absorb shock loads from uneven road surfaces, therefore general ride quality is much improved.

L.TRA.EA.C.M**3. VERY IMPORTANT NOTES****Gross Vehicle Weight (GVW)**

Air assist kits are not in themselves designed to increase the gross vehicle weight (GVW) rating of a vehicle. They do not legally allow for carriage of a load greater than the carrying capacity stated on the data plate of the vehicle.

Do not exceed the maximum load specified by the vehicle manufacturer...

- ♦ to avoid compromising passenger safety
- ♦ to prevent possible damage to the vehicle
- ♦ for legal reasons

**Load Sensing Valve (LSV) Adjustment**

If your vehicle is not fitted with an antilock braking system (ABS) then it will have a load sensing valve (LSV) to automatically adjust braking force under varying load conditions. This valve **must** be adjusted immediately after the fitting of an air assist kit and before the vehicle is driven again on public roads.

If the LSV is not adjusted following the fitting of an air assist kit, it may misjudge rear load conditions to the extent that the braking pressure applied to the rear brakes is not correct (e.g. the rear wheels may lock with no load on the rear axle). The consequences of this in terms of vehicle stability and safety are potentially serious.

Vehicle Upgrading

Despite the above words of caution, it is possible to upgrade the weight rating of your vehicle. This must be carried-out by a specialist supplier that will...

- ♦ carry out any necessary modifications in addition to fitting the air assist kit
- ♦ complete documentation as necessary to inform the Vehicle and Operator Services Agency (VOSA) – a mandatory requirement
- ♦ supply and fit a new weight plate to replace the original plate supplied with the vehicle

This process applies to United Kingdom registered vehicles. The process in other countries may be different.

4. OVERVIEW

The diagram below is an overview of the complete assembly...

Number	Part Number	Description	Quantity
①	21.04.00.1.01.01	Top Bracket, Left and Right	2
②*	21.04.00.1.01.02	Bushing Top Bracket	2
③	21.04.00.1.04	Lower Bracket, Left	1
④	21.04.00.1.05	Lower Bracket, Right	1
⑤	OP.LB.170-2.CPL	Air Spring, 170/2	2

* only 2000 - 2006

5. INSTRUCTIONS FOR INSTALLATION

Preparation and Precaution

Before beginning installation, ensure that you have sufficient clearance between the axle and the chassis. Use a jack if necessary. Install at one side of the vehicle at a time.

Pay attention to your safety at all times during installation - always use axle stands to support the vehicle!

The following instructions make reference to the diagrams on pages 17 to 18 inclusive.

5.1 Removal of Bump Stop from Chassis

- i. Your vehicle will have one of two shapes of rubber bump stop fitted to the chassis, either broadly oblong or round. See page 15

Oblong Bump Stop

- ii. Unscrew and Remove the bolt from the 'tab' bracket at one end of the bump stop—Figures 1
- iii. Rotate the bump stop downwards from the end now freed and remove it from the chassis by unhooking the clip at the other end—Figures 2

Round Bump Stop

- ii. Unscrew and Remove the single, centrally-located bolt from the bump stop and lower it away from the chassis—Figures 6 and 7

Ford Transit V184 and V384

Rear Wheel Drive *single tire*

L.TRA.EA.C.M

5.2 Attachment of Upper Bracket to Chassis

- i. The upper bracket is attached to the chassis in the area left vacant by removal of the bump stop. The method of attachment is a little different depending upon which type of bump stop was removed...

Oblong Bump Stop

- ii. Feed the top bracket up to the chassis, taking care to orientate correctly (longest protruding part of bracket nearest to the wheel) - Figure 3
- iii. Attach the bracket to the chassis using the long bolt, tube, washers and nut as shown in Figures 4 and 5. Note that (a) the bolt is inserted from the wheel-side of the chassis and (b) the larger of the two washers is on the inside of the chassis.

Round Bump Stop

- ii. Feed the top bracket up to the chassis, taking care to orientate correctly (longest protruding part of bracket nearest to the wheel) - Figure 7
- iii. Attach the bracket to the chassis using a single bolt and spring washer, making use of the threaded hole left vacant by removal of the bump stop—Figure 8 (always check the pitch of the thread)

5.3 Installation of the Air Springs

- i. Position the lower bracket against the flange beneath the axle — Figure 9
- ii. Attach the lower bracket to the flange via two bolts, two nuts and four flat washers — Figure 10
- iii. Place the air spring onto the lower bracket with the air tube uppermost and then pass the tube through the large hole in the upper bracket
- iv. Attach the air spring to the lower bracket using two M8 x 16mm bolts and two M8 washers. Do not fully tighten the bolts at this stage because the bellow may require alignment once inflated (Figure 11, Section 5.8).
- v. Remove the bung from the tube. The spring now inflates until its top plate comes into contact with the upper bracket of the air assist kit.
- vi. Attach the upper bracket to the top plate of the air spring using two M8 x 16mm bolts and two M8 washers. Do not fully tighten the bolts at this stage because the bellow may require alignment once inflated (Figure 11, Section 5.8).

Ford Transit V184 and V384

Rear Wheel Drive *single tire*

L.TRA.EA.C.M

The following instructions are only for vehicles without ABS. This may concern some vehicles from 2000 up to 2006.

5.4 Load Sensing Valve (LSV) Adjustment

Vehicles without an antilock braking system have a load sensing valve fitted. This has a spring linkage as shown by Figures 12 and 13. The LSV must be adjusted.

This is a relatively simple matter of adjusting the length of the spring linkage via the adjustment ring until the length of the rod is the same as it was before beginning installation.

- i. Deflate the air bellows completely, measure and record the **length A** of the spring from the top mounting bracket to the tip of the linkage rod Figure 15.
- ii. Inflated such that the desired vehicle ride height is achieved,(Mostly is the rear side of the vehicle app. 4 cm higher then front side, which is approximately 13,5 cm air bellow height).
- iii. measure and record the **length b** of the spring from the top mounting bracket to the tip of the linkage rod Figure 16.
- iv. Disconnect the bracket of the LSV from the rear axle Figure 17.
- v. The adjustment ring has a screw that locks it to the rod when tightened and enables the ring to slide along the rod when loosened. Move the adjustment ring upwards over a length of **A-B** Figure 18.
- vi. Connect the LSV bracket again to the axle and the adjustment is done.

L.TRA.EA.C.M

5.5 Fitting of Inflator Console

Option Valves

Option 1

Option 2

Option 3

Your kit is supplied with one of the inflator console options shown above...

- 'Option Valves', having two valves and a bracket (above, top-left)
- 'Option 1', 'Option 2' or 'Option 3', having both valves and pressure gauges

Mount the console in a position of your choice whereby it is firmly fixed, has some protection from the environment (particularly important for the console with gauges) and is easily accessible. Suggested possible locations include...

Console with Valves Only...

- on the rear bumper
- at the rear beside the license plate
- on the chassis next to a rear wheel
- in a service shutter
- beside the fuel cap

Console with Valves and Gauges...

- in the vehicle cabin, within reach and sight of the driver
- in the wall of a cupboard (motorhomes)
- in a service shutter

'Comfort' Packages

The 'Option 2' and 'Option 3' panels, as shown above, are each part of a *Comfort Package* that is supplied with a compressor (and also an air reservoir in the case of the 'Option 3' panel) for ease of spring inflation and ride height setting. For further information please ask your dealer.

L.TRA.EA.C.M**5.6 Tube Connection and Disconnection, Cutting and Routing****Connection and Disconnection**

Tubes are connected as shown by the diagrams below...

- A. Slide a nut over the end of the tube
- B. Push the tube onto the connector as far as possible
- C. Feed the nut up to the connector, fully tighten by hand and finally tighten one additional turn using spanners

Cutting

To achieve good sealing and air-tight fitting of tube ends to their connecting parts, it is very important to cut tubing cleanly and squarely. A dedicated guillotine action tubing cutter is recommended, or a craft knife if such a tool is not available. Do not use electrician's side cutters.

A dedicated tubing cutter -
Recommended

Electrician's Side Cutters
NOT Recommended

L.TRA.EA.C.M**Routing**

Study the underside of the vehicle and decide how to route each branch of the air circuit...

- To minimise the risk of chafing, avoid running tubing over metal edges as much as possible
- Avoid close proximity to heat sources such as the exhaust assembly
- Choose a route that provides as much protection as possible from dirt, debris and any solid objects that may impact the underside of the vehicle

It is recommended that tubes are guided alongside brake lines as much as possible.

Use cable ties ('tie wraps') to secure tubing to the chassis, taking care not to over-tighten them.

5.7 Spring Inflation

Once installation of the air assist kit is complete, inflate the springs via the inflator console taking careful note of the following...

**Maximum and Minimum Pressure****Maximum Pressure 7.0bar****Minimum Pressure 0.5bar**

Do not exceed 7.0bar (101psi), which is the recommended maximum charge pressure for the air springs.

The springs may be deflated if the vehicle is to be stored for a lengthy period without use, but a pressure of at least 0.5bar (7.25psi) should be maintained at all times in order to avoid possible compression damage to the springs.

L.TRA.EA.C.M

5.8 Spring Alignment

CAUTION!

Before fully tightening the bolts that secure the air spring to the upper and lower brackets, set the vehicle at ride height (spring height approximately 13.5cm) and ensure that the springs are correctly aligned.

5.9 Maintenance

Following installation, it is recommended that all metal parts are coated with a protective substance such as body wax.

The system does not require very much maintenance other than...

- ♦ to maintain air pressure in the springs. Much like a tyre, the system may lose a little air over time.
- ♦ to keep the air bellows clean. It is suggested that, when washing the vehicle, the bellows are inspected and cleaned as necessary (preferable by spraying). Look in particular for stones or grit trapped between convolutes, as this may damage the bellow.
- ♦ Check before and after the winter period the wax coating. Re-wax when necessarily
